

Search Marketing Plan — ABRON Engineering Technologies Limited

Prepared by: *AROWOJEBE SHERIFFDEEN A. (Jebson)*

Role: SEO Intern

Date: *21st/07/2026*

Observations:

We've got two distinct businesses under one brand — a **training school** (jobseeker/trainee intent) and a **B2B engineering services provider** (procurement/decision-maker intent). The whole plan hinges on keeping those two audiences separate rather than blending them on the same pages or campaigns, because Google will never rank (or convert) one page well for both "oil and gas training Lagos" and "hydro testing service provider, sir."

One thing to flag right away: the website footer lists the head office as "**No 32, Akinremi Street**" while you gave me "**78 Akinremi Street.**" Before touching Google Maps, this needs to be reconciled to one exact address everywhere — website, GBP, directories — or Google will flag the listing for inconsistency and suppress it in local results., sir.

1. Google Search Ads

Campaign A — Training & Certification

- Ad groups: Valve Maintenance Training, Instrumentation/Automation Training, Electrical Training, HVAC Training, General Oil & Gas Job Training
- Example keywords: "oil and gas training school Lagos," "valve maintenance training Nigeria," "instrumentation training Lagos," "oil and gas certificate course Nigeria," "how to get a job in oil and gas Nigeria"
- Landing pages per ad group: course details, dates/calendar, certification, job-support angle
- Extensions: sitelinks (Courses, Calendar, Testimonials, Contact), call extension, location extension

Campaign B — Engineering Services (B2B leads)

- Ad groups: Hydro Testing, Instrumentation & Calibration, Process Automation, Bolt Tensioning & Torquing, General Procurement
- Example keywords: "hydro testing pipeline Nigeria," "valve hydro test service Lagos," "instrument calibration company Lagos," "bolt tensioning services Nigeria," "NCDMB approved supplier"

- Landing pages: technical specs + credibility (ISO 9001, COREN, NCDMB), CTA "Get a Quote"
- **Negative keywords are critical here** — exclude jobseeker terms ("training," "course," "certificate") from this campaign so budget doesn't leak into the wrong intent, and vice versa

Targeting & setup

- Geo: Lagos, Port Harcourt, Warri, plus wider Niger Delta
 - Mobile-first bidding and landing pages (Nigeria is heavily mobile)
 - Start on Manual CPC/Maximize Clicks for 30–60 days to gather data, then shift to Maximize Conversions
 - Set up **call conversion tracking** on both support lines (this matters a lot — your CTAs are phone-heavy) plus form-fill and calendar-download tracking
-

2. SEO

Structure fix first

Right now services and courses are folded into homepage sections rather than living on their own indexable URLs. Give each one a real page:

- [/services/hydro-testing](#), [/services/instrumentation-calibration](#), [/services/process-automation](#), [/services/bolt-tensioning-torquing](#)
- [/training/valve-maintenance-repair](#), [/training/electrical](#), [/training/automation](#), [/training/hvac](#)

Each page needs: unique title/meta, one keyword-matched H1, 500–800 words of real technical content, an FAQ block, and internal links cross-selling between the training and service sides ("train in this skill" ↔ "hire us for this service").

Schema markup — Organization/LocalBusiness, Service schema per service page, Course schema for the training programs (strong rich-result potential in Nigeria's less-competitive SERP), FAQ schema.

Content

- Your existing blog (digital twins, local content, harmonics) is a solid foundation — keep the cadence and expand into long-tail queries: "how much does valve calibration cost in Nigeria," "bolt tensioning vs torquing difference," "NCDMB approved training centers list"
- Lean into "NCDMB," "COREN," and "local content" as topical-authority anchors — these carry real trust weight in Nigerian oil & gas search behavior and you already have the credentials to back them up

Off-page

- Target mentions/backlinks from NCDMB, COREN, Nigerian engineering associations, and energy-sector press (e.g., BusinessDay Energy)
 - Get listed on oil & gas B2B directories active in Nigeria/West Africa
-

3. Google Maps (Google Business Profile) Optimization

Multi-location, not one profile

You have 3 addresses in the footer (Lagos HQ, Port Harcourt, Warri) — each needs its **own verified GBP listing**, not a single profile trying to represent all three. People search "near me" per city.

Category & services

- Pick the most specific primary category Google offers (test "Oil & gas company," "Engineering consultant," "Industrial equipment supplier" — whichever matches best)
- Add each service line individually in the Services/Products tabs: Hydro Testing, Instrumentation & Calibration, Process Design & Automation, Bolt Tensioning & Torquing, plus Training Programs — each with a short keyword-natural description

Proof & activity

- Upload real site photos you already have (substation work, calibration, welding, classrooms) — geo-tagged, categorized
- Weekly GBP posts tied to blog content, training calendar dates, and completed projects
- Build a systematic **review request flow** — ask training graduates and B2B clients to leave Google reviews that naturally mention the specific service they used (this directly feeds Maps' relevance signal)
- Seed the Q&A section with obvious questions ("Do you offer NCDMB certified training?" "Do you do hydro testing for Port Harcourt clients?")

Citations

Get NAP-consistent listings on Nigerian directories (VConnect, Nigeria Galleria, ConnectNigeria) and any oil & gas-specific directories — this is one of the three core local ranking pillars (proximity, relevance, prominence) and cheap to fix once the address is settled.

4. [REDACTED]

Facebook works differently from Search — there's no search intent to target, so it's really two separate plays here, matching the same audience split as before.

Campaign A — Training & Enrollment (lead gen)

Objective: Lead Generation (in-platform form) rather than "traffic to website" — Nigerian mobile users convert much better on native lead forms than on slow-loading landing pages

Audience: young adults/graduates in Lagos, Port Harcourt, Warri and Niger Delta states interested in engineering, vocational training, "get a job," NYSC-adjacent audiences (many trainees are recent grads or corps members)

Creative angle: short video/reels of real training sessions (calibration bay, welding, classrooms — you already have these photo assets), graduate testimonials, "job support after training" as the core hook — this is your biggest differentiator vs generic training centers

CTA: "Get Training Calendar" as lead magnet, followed by retargeting for enrollment deadlines

Retargeting: website visitors who viewed course pages but didn't submit the form

Campaign B — Engineering Services (B2B awareness + leads)

Facebook is weaker for B2B procurement decision-makers than LinkedIn, but still useful for brand credibility and remarketing in Nigeria, where a lot of SME/mid-size procurement contacts are still active on Facebook

Objective: Traffic or Lead Gen depending on budget; keep expectations modest on cost-per-qualified-lead here vs Search Ads

Creative: project photos/videos (substation work, calibration, welding), ISO/NCDMB/COREN credibility badges, client testimonials

Consider running this mainly as retargeting for people who visited the service pages via Search Ads or SEO but didn't convert — cheaper and higher-intent than cold prospecting

A LinkedIn Ads line item would genuinely outperform Facebook for this audience if budget allows later — worth flagging even though it's outside today's ask

Budget logic across all four channels

Google Search Ads (Training + Services): highest intent, gets first priority budget

Facebook Training campaign: strong second priority — good for volume/awareness where Search demand is still low (many jobseekers don't yet know to search for specific course names)

Facebook Services campaign: smallest allocation, mostly retargeting

SEO/GBP: no ad spend, but needs the content/ops time investment described earlier

Tracking

Meta Pixel + Conversions API on the site (works alongside the Google Tag already needed for Search Ads)

Use the same call-tracking number scheme so you can tell whether a phone lead came from Facebook or Google

Suggested order of operations

1. **Fix the address inconsistency**, then split/verify GBP profiles per location — everything else depends on this being right first
2. Build the dedicated service/training landing pages with schema
3. Launch Search Ads in parallel once landing pages exist — no need to wait for SEO to finish, this gets leads flowing while SEO ramps over months
4. Ongoing: content cadence, backlinks, reviews, GBP posts.
